

Solution:

To find the historical cost, let us try to understand what the tables are trying to tell.

The net depreciation that occurred during 2011 is given by:

$$\text{Net Depreciation} = \$4,146.2 - \$3,822.0 = \$324.2$$

Thus, we have accumulated a depreciation of \$324.2 million during fiscal 2011. Now, this is less than the expected depreciation expense of \$472.6 million, which indicates that some of the assets have been sold.

To find the value of assets that is gained, we can consider the increase in assets as:

$$\text{Increase in Assets} = \$7,492.1 - \$6,949.7 = \$542.4$$

This is the increase in the assets that year. However, we had bought equipment worth \$848.8 million during that time.

Thus, there must be a disposal of $\$848.8 - \$542.4 = \$306.4$ millions of assets in fiscal 2011.

Moreover, the expected depreciation of these assets was $\$472.6 - \$324.2 = \$148.4$ millions, resulting in book value of assets being $\$306.4 - \$148.4 = \$158$ million, which matches the value given in the question.

Thus, we get the following:

- (1) \$306.4 million
- (2) \$148.4 million
- (3) \$158.0 million
